

LPWAN Binary Payload - 8 to 72 Bytes

Byte offset	Size	Field	Type	Encoding / scaling	Description
0	1	variant_msb	uint8	High byte of AION_VARIANT_CODE()	Module base and major-version bits
1	1	variant_lsb	uint8	Low byte of AION_VARIANT_CODE()	Minor-version and subtype bits
2	1	uplink_counter	uint8	Incremented for each encoded LPWAN telemetry message	Uplink counter
3..4	2	vendor_id	uint16	IO-Link Vendor ID; byte order to be verified	Vendor identity of the connected IO-Link device
5..7	3	device_id	uint24	IO-Link Device ID; byte order to be verified	Device identity of the connected IO-Link device
8..(7+n)	n = 0..32	pdin	byte array	Raw IO-Link process-input data	Interpretation depends on the sensor and its IODD
(8+n)..(7+n+m)	m = 0..32	pdout	byte array	Raw IO-Link process-output data	Output data provided by the IO-Link master

Preliminary representation: n is the length of pdin and m is the length of pdout. The final boundary of the variable fields and the byte order of vendor_id and device_id must be verified against the production encoder.
